

SILOBREAKER

Global financial services firm elevates intelligence analysis with Silobreaker

Impact study

Overview

A global financial services firm uses Silobreaker to strengthen intelligence collection, improve collaboration across analyst teams, and deliver higher-quality reporting at speed. By unifying workflows, the organization provides clearer insight to decision-makers across cyber, geopolitical, and physical risk domains.

Company information.

Global Financial Services Firm
100,000+ employees

Solution users.

CTI analysts
Geopolitical risk analysts
Physical security analysts
Cybercrime analysts
Security operations center

Challenge.

Analysts across the firm spent significant time manually sourcing intelligence from internal systems and external platforms. Limited source coverage increased the risk of missing critical signals and placed sustained pressure on teams to meet stakeholder expectations.

Intelligence efforts were also fragmented. Cyber, geopolitical, and strategic analysts often tracked the same threats in parallel without a shared environment to collaborate or exchange insight. This resulted in duplicated work and reduced coherence, particularly when monitoring complex, long-running issues such as nation-state activity and geopolitical conflict.

Inefficient collection, analysis, and reporting workflows affected both speed and quality. As a result, senior leaders lacked the timely, contextual intelligence needed to take a more proactive approach to threat management.

Solution.

Silobreaker provided a single platform to support the full intelligence lifecycle, from automated collection and processing of open-source, deep and dark web, and finished intelligence, through to analysis, reporting, and dissemination.

Custom dashboards and integrations were configured to reflect the firm's intelligence requirements. Through structured training, analyst teams across disciplines were able to adopt the platform quickly and work within a shared workflow.

Analytical tools support both detailed campaign analysis and broader trend monitoring over time. A standardized reporting process enables intelligence to be shared efficiently with relevant stakeholders, improving consistency and coordination across teams.

Outcome.

With Silobreaker, the firm has improved both efficiency and impact:

Broader intelligence coverage, delivering a more complete view of cyber, geopolitical, and physical risks

Stronger collaboration across analyst teams, reducing duplication and improving insight sharing

Faster, higher-quality reporting that supports confident, proactive decision-making

Ability to move seamlessly between tactical investigation and strategic, long-term analysis

Access to premium deep and dark web intelligence for improved visibility into underground activity

Expanded intelligence support to additional functions, including supplier risk management

By bringing people, sources, and workflows together, the firm delivers intelligence that helps leaders act with greater clarity and confidence.

About Silobreaker

Silobreaker is an AI-native intelligence platform that unifies data, advanced analytics and human expertise to deliver high-quality insights where it matters most. Designed for security, threat and risk teams, the Silobreaker proprietary intelligence engine automates the collection, fusion and analysis of cyber, geopolitical and physical data. With PIR-driven workflows, agentic automation and executive-ready reporting, Silobreaker helps global enterprises and governments anticipate threats, accelerate decisions, protect their people, operations and assets, and build resilience with confidence.
